

Volodya

Schelkovo Agrohim JSC

Very high and stable yield. High stability of productivity traits and increased protein content. A low-growing variety with high lodging resistance. Good immune properties.

General information

Crop: winter wheat

Variety: Lutescence

Maturity group: mid-season-ripening

Vegetation period: 304 to 310 days

Yield: 12.6 t/ha (Orel Region)

Hybrid morphological properties:

- bush type: semi-lodging
- spike: cylindrical, of medium density, white. The awnlike offshoots at the spike top are very short.
- leaf: intensive green, with a weak wax deposit,
- weight per 1,000 kernels: 43 g, grain unit: 780-800 g/l
- plant height: to 100 cm

Resistance to disease

- winter hardness: high
- Drought resistance: high
- disease resistance: has resistance to brown and yellow rust, to powdery mildew, average receptive to Fusarium mold
- lodging resistance: high

Value

- high protein content up to 18-19%
