General information

Crop: Spring wheat
Variety: Lutescence
Producing region: North Western (2), Central (3), Central Black Earth (5)
Maturity group: mid-season-ripening
Vegetation period: 85 to 95 days, it matures simultaneously with the Prokhorovka reference standards Lada
Yield: 72.6 dt/ha (Lipetsk Region)
Hybrid morphological properties:

- bush type: erect and semi-erect
- Straw: slightly filled The wax deposit is very heavy on the upper internode of the straw, and it is also heavy on the flag leaf sheath and lamina
- spike: pyramidal, of medium density
- weight per 1,000 kernels: 33-38 g

Resistance to disease

— moderately susceptible to Septoria blight, susceptible to brown rust, loose and solid smut, moderately susceptible to powdery mildew

— • lodging resistance: exceeds the reference standards by 0.6 scores to 1.0 scores

Value

— valuable wheat for its bakeability
