

DF 2020

DF 2020

Schelkovo Agrohim

General information

Crop: winter wheat

Variety: Lutescence

Producing region: Central (3), Volga and Vyatka (4), Central Black Earth (5)

Maturity group: ultra-short-season-ripening

Vegetation period: 300 to 310 days It ripens by 5-7 days earlier than the reference period for the Moskovskaya 39 grade.

Yield: medium in production seeds, at 67.8 (above the reference standard of the Moskovskaya 39 grade by 7.5 dt/ha)

Hybrid morphological properties:

- bush type: erect
- spike: rectangular or claviform in wet years, dense, white. The awns are short at the spike top
- weight per 1,000 kernels: 40.5 g, grain unit: 766 g/l
- straw: thick, durable, medium-solid

- leaf: intensive green, with a heavy wax deposit, wide
- plant height: 95 to 100 cm

Resistance to disease

- winter hardness: very high, by 7 scores above the reference standard
- Drought resistance: high.
- Disease resistance: resistant to Fusarium mold, susceptible to Septoria blight, and has standard resistance to brown rust
- lodging resistance: high, above the reference standard

Value

- very valuable for the grain quality
